GSEA GO, Aged vs Young, enriched in the young group
RNA splicing
mRNA metabolic process
response to retinoic acid
collagen metabolic process
muscle organ development
multicellular organismal movement
cellular component assembly involved in morphogenesis
ribonucleoprotein complex biogenesis
protein−RNA complex organization
actomyosin structure organization
cardiac chamber development
muscle system process
actin filament−based movement
protein−DNA complex organization
BP
spliceosomal complex
contractile fiber
chromatin
sarcoplasm
ribosome
collagen trimer
CC
mRNA binding
single−stranded DNA binding
transporter regulator activity
single−stranded RNA binding
ribonucleoprotein complex binding
dioxygenase activity
transcription factor binding
MF

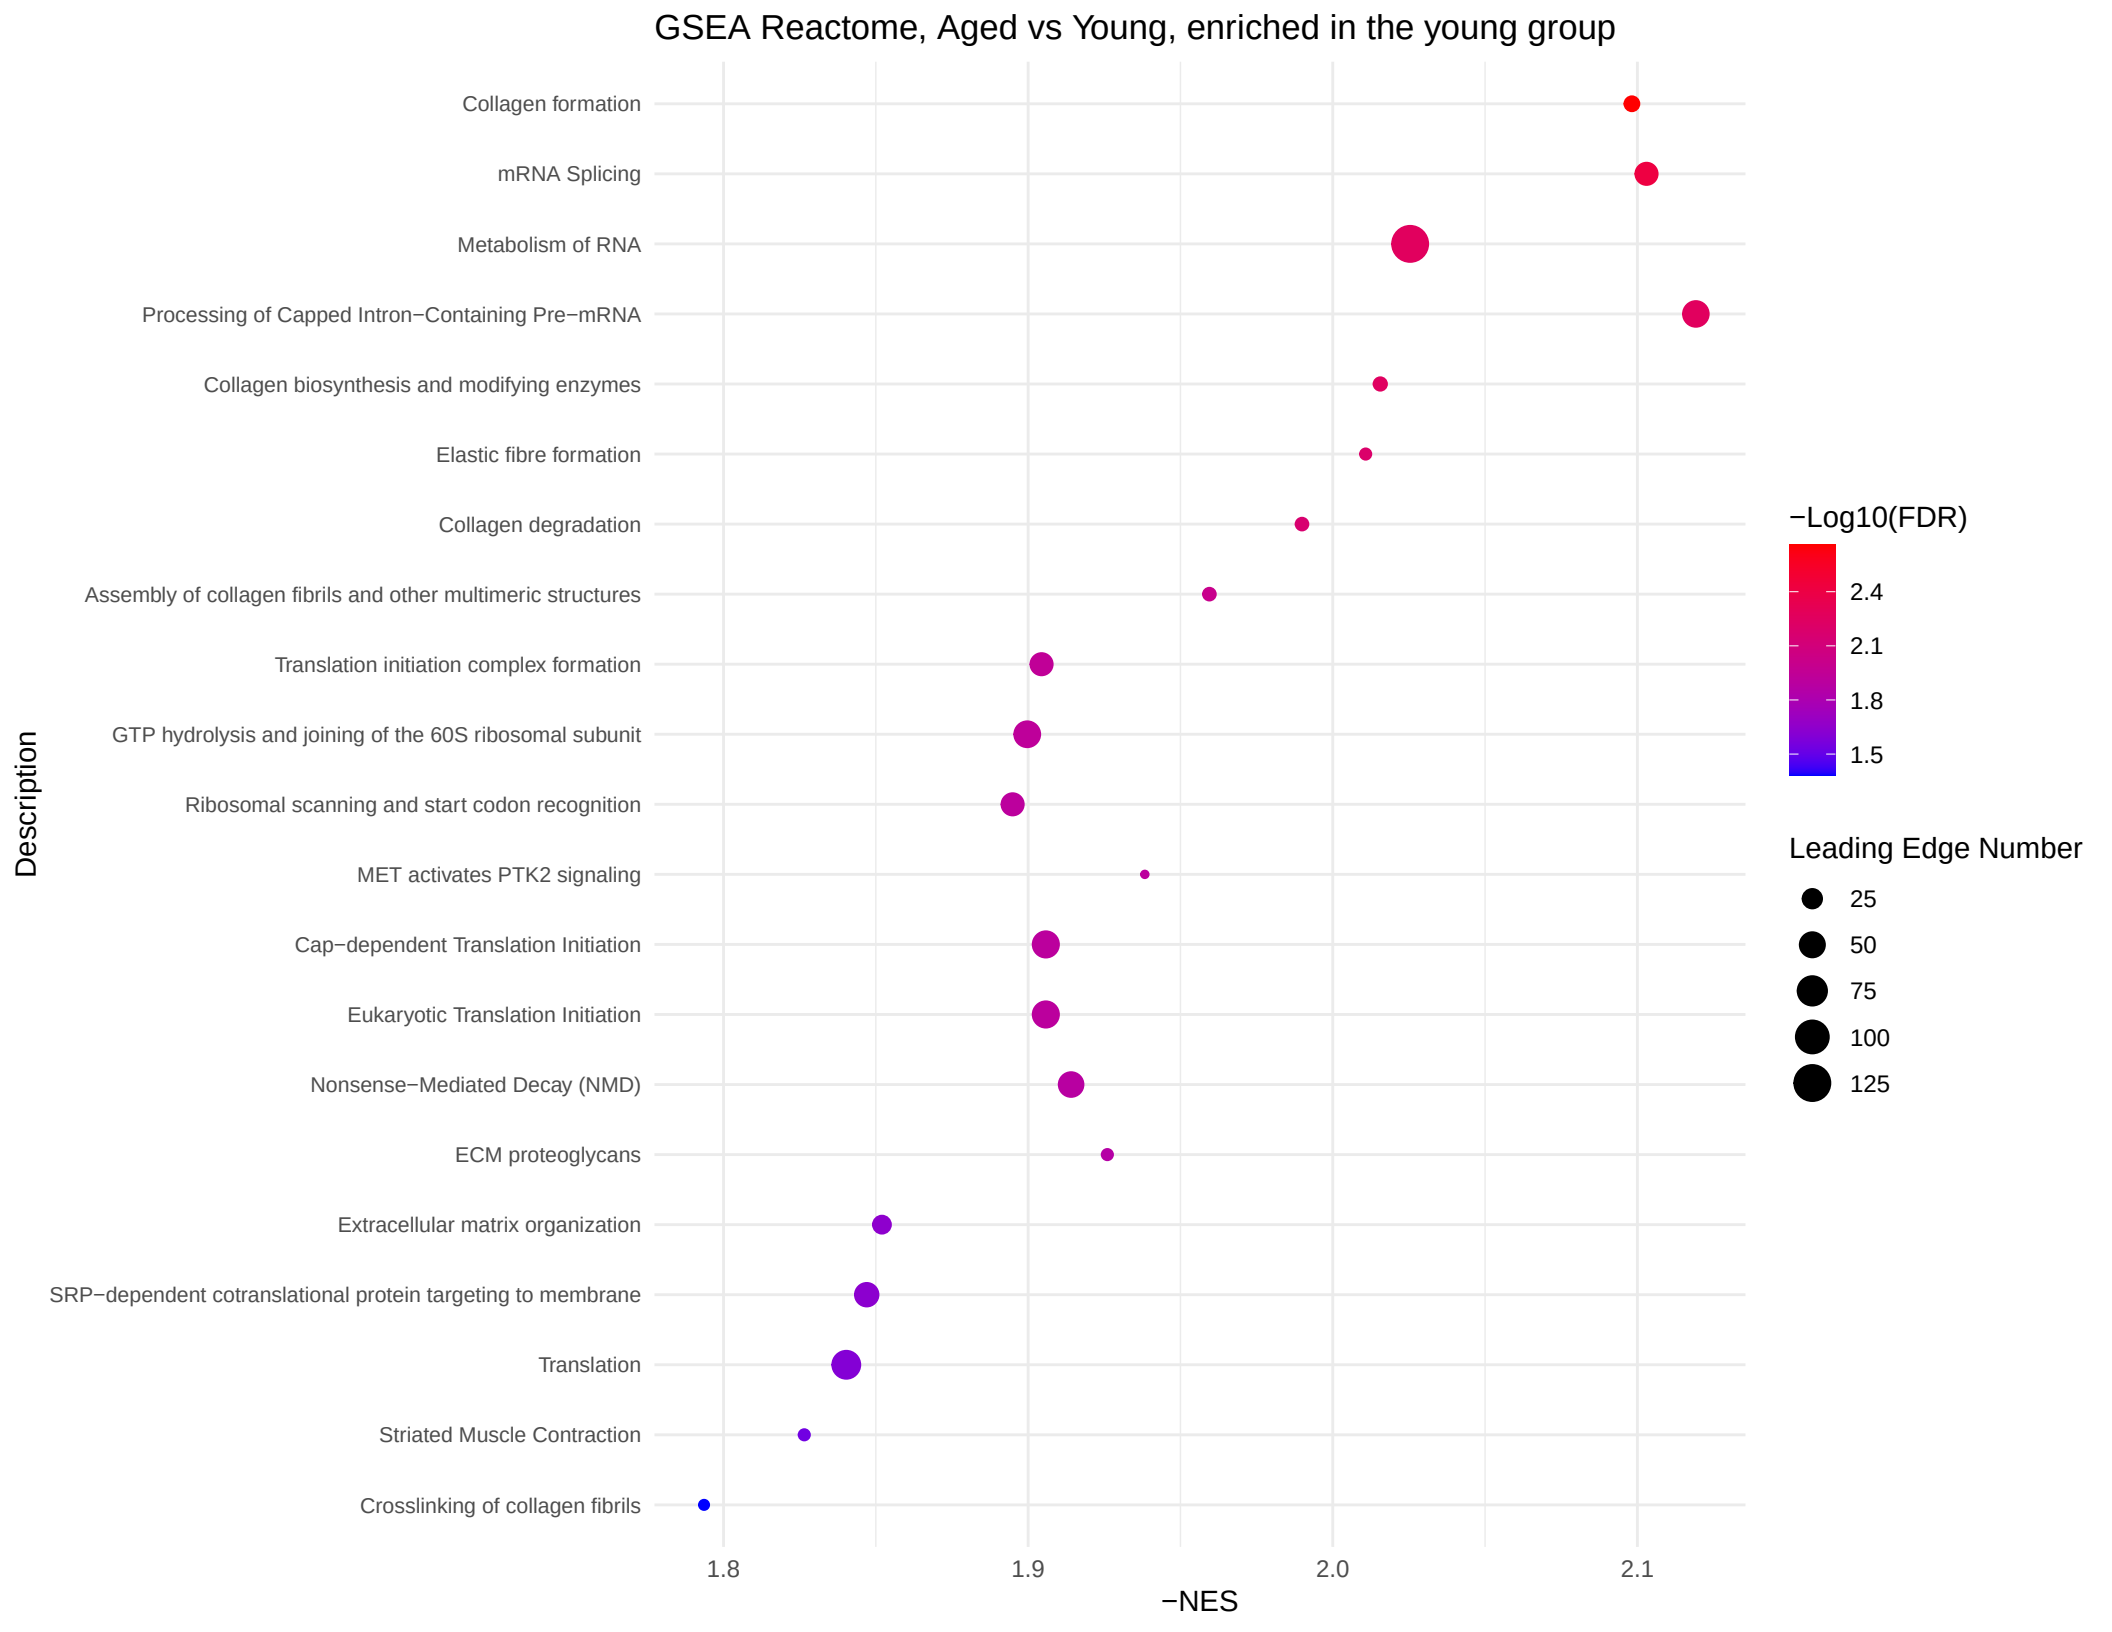
4



GSEA Reactome, Aged vs Young, enriched in the young group
Collagen formation
mRNA Splicing
Metabolism of RNA
Processing of Capped Intron−Containing Pre−mRNA
Collagen biosynthesis and modifying enzymes
Elastic fibre formation
Collagen degradation
Assembly of collagen fibrils and other multimeric structures
Translation initiation complex formation
GTP hydrolysis and joining of the 60S ribosomal subunit
Ribosomal scanning and start codon recognition
MET activates PTK2 signaling
Cap−dependent Translation Initiation
Eukaryotic Translation Initiation
Nonsense−Mediated Decay (NMD)
ECM proteoglycans
Extracellular matrix organization
SRP−dependent cotranslational protein targeting to membrane
Translation
Striated Muscle Contraction
Crosslinking of collagen fibrils
